

DSD Pedal quick start guide

Thanks for purchasing the DSD/SIFA pedal from TS Controllers. The pedal is preconfigured by TS controllers and is effectively plug and play once the TS Controllers interface is installed.

Before using the pedal you will need to have the TS Controllers interface installed. Please visit the support page of the website to download this.

The Pedal uses the API (Application programming interface) to communicate with both Train Sim Classic and Train Sim World.

This works automatically with Train Sim Classic. With Train Sim World you need to add the -httpapi Steam launch option so the interface can 'connect' to TSW5/6. See the support page of the website on how to do this, or information within the interface.
